APPLICANT: Cole, Stewart
APPLICANT: Buchrieser-Brosch, Roland
APPLICANT: Gordon, Stephen
APPLICANT: Billault, Alain

```
Sequence 727, Application US/09670314

Patent No. 6492506

GENERAL INFORMATION:

APPLICANT: Cole, Stewart

APPLICANT: Cole, Stewart

APPLICANT: Buchrieser-Brosch, Roland

APPLICANT: Buchrieser-Brosch, Roland

APPLICANT: Billault, Alain

TITLE OF INVENTION: METHOD FOR ISOLATING A POLYNUCLECTIDE OF INTEREST FROM

TITLE OF INVENTION: LIBRARY APPLICATION TO THE DETECTION OF MYCOBACTERIA

TITLE OF INVENTION: LIBRARY APPLICATION TO THE DETECTION OF MYCOBACTERIA

TILE REFERENCE: 3495-0169

CURRENT APPLICATION NUMBER: US/09/670,314

CURRENT STLING DATE: 2001-01-12

PRIOR APPLICATION UNUMBER: 09/060,756

PRIOR FILING DATE: 1998-04-16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ; SOFTWARE: PatentIn Ver. 2.; SEQ ID NO 727; LENGTH: 318; TYPE: PRT; ORGANISM: Mycobacterium s; US-09-060-756-727

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    has at least one CDR (complementarity determining region) loop sequence, or part of it, modified or replaced so that, compared to unmodified VLD, its solubility is increased and/or the size is altered and/or a disulphide bond is created within, or between, one or more CDR loops. (I) are used for diagnosis, e.g. in vivo detection/localisation of cancer, blood clots etc., also in vitro when immobilised on solid supports or blosensors and therapeutically. Modified VLD may have binding affinity for drugs, steroids, pesticides, antigens, growth factors, tumour markers, cell or viral proteins. Modification of VLD improves solubility and alters binding specificity. Since VLD are derived from human proteins, the need for a humanizing step (to avoid adverse immune responses) is avoided, and modification also improves expression in
The present sequence is the heavy chain complementarity determining region 2 of an anti-cancer specific antigen human monoclonal antibody (hMAb). The hMAb can be used in medicine, e.g. clinical diagnosis of cancer or immunotherapy, or to purify cancer specific antigen. The industrial scale production of large amounts

                                                                                                            are composed of native human protein sequences and are therefore attractive potential respents for therapeutic purposes. They provide a new class of antithrombotic agents, useful for the prevention of platelet-dependent thrombi in diseased arteries, bypass grafts, dialysis etc., and can also be used as diagnostic reagents. Methods of inhibiting aggregation of platelets, of binding human platelet efpli alpha and of selecting a VH or VL region of an antibody that inhibits platelet aggregation are claimed. Fragments of the scFv VH or VL chain, including CDR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                basis of their binding to platelet GPIb. Whether displayed as surface proteins on a phagemid or secreted as free scrv by Escherichia coli, the HIb scrv clones are capable of inhibiting you willebrand factor-dependent aggregation of platelets. The synthesis of the secret of the secr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              against platelet glycoprotein Ib (GPIb). The HIb series of scFv was isolated from a human synthetic VH and VL scFv library on th basis of their binding to platelet GPIb. Whether displayed as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of complementarity determining 2 (CDR2) of the heavy chain variable region (VH) of human single chain antibody (scFv) Hib-3 (see AAY95219), which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Variable heavy chain; single chain antibody; scFv; h glycoprotein Ib alpha; platelet; aggregation; antiag antithrombotic; thrombus; therapy; diagnostic; CDR2;

                                                                                                                                                                                                 The invention provides isolated antibodies, or antigen-binding portions, CC that are capable of binding to human interleukin-18 (II-18). The CC antibodies may be used to inhibit human II-18 activity in, and treat a CC disorder where II-18 is detrimental in, a human subject suffering from, CC inflammatory disorders (e.g., rheumatoid arthritis, Crohn's disease, CC (e.g., Huntington's chorea, Parkinson's disease, Albeimer's disease, and CC (e.g., Huntington's chorea, Parkinson's disease, Albeimer's disease, and CC (e.g., depression and schizophrenia). Treatment with an anti-II-18 CC (e.g., depression and schizophrenia). Treatment with an anti-II-18 CC (e.g., depression and schizophrenia). Treatment with an anti-II-18 CC second agent selected from an antibody, or fragment, capable of binding CC human II-12, methotrexate, anti-tumor necrosis factor, corticosteroids, CC cyclosporin, rapamycin, FK506, and non-steroidal anti-Inflammatory CC depress. The present sequence represents an anti-II-18 antibody LT28 heavy chain CDR2 fragment.

                                                                                                                           inflammatory bowel disease, and osteoarthritis), neurological disorders (e.g., Huntington's chorea, Parkinson's disease, Alzhaimer's disease, and stroke), heart failure, myocardial infarction, autoimmune diseases such as autoimmune hepatitis and autoimmune neutropaenia, and mental disorders (e.g., depression and schizophrenia). Treatment with an anti-II-18 antibody may occur before, concurrent, or after administration of a second agent selected from an antibody, or fragment, capable of binding human II-12, methotrexate, anti-tumor necrosis factor, corticosteroids, cyclosporin, rapamycin, FK506, and non-steroidal anti-inflammatory agents. The present sequence represents an anti-II-18 antibody heavy chain variable region fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ghayur T,
Duncan AR,
                                                                                                                                                                                                                                                                                                             The invention provides isolated antibodies, or antigen-binding portithat are capable of binding to human interleukin-18 (IL-18). The antibodies may be used to inhibit human IL-18 activity in, and treat disorder where IL-18 is detrimental in, a human subject suffering frinflammatory disorders (e.g., rheumatoid arthritis, Crohn's disease, inflammatory disorders (e.g., rheumatoid arthritis, Crohn's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel antibodies and compounds capable of binding to human interleukin-18 useful for treating, e.g., inflammatory disorders, neurological disorders, heart failure, myocardial infarction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           II-18; interleukin-18; human; antibody; antirheumatic; cerebroprotective;

                                                                                                                                                                   Qy
                                                                                                                                                                                                                                                                                                  The invention relates to a novel purified preparation of a human CC antibody, which binds to a tissue inhibitor of metalloprotease-[ (TIMP-1) CC and neutralises a matrix metalloprotease (MMP)-inhibiting activity of CC TMP-1. The antibody comprises a variable heavy chain (VHC)DR3 region and CC a variable light chain (VLC)DR3 region. An antibody preparation of the CC invention has hepatotropic, cytostatic, nephrotropic and cardiant CC activity. The human antibody is useful for decreasing an MMP-inhibiting CC activity of a TIMP-1. It is especially useful for ameliorating the CC symptoms of a disorder in which TIMP-1 is elevated, e.g. liver CC symptoms of a disorder in which TIMP-1 is elevated, e.g. acute coronary CC syndrome, lupus nephritis, glomerulosclerotic renal disease, idiopathic CC pulmonary fibrosis, benign prostate hypertrophy, lung cancer or colon CC cancer. The antibody is also useful for detecting a TIMP-1 in a test CC elevated. The present sequence represents a VHCDR1 region of an antibody.
                                                                                                                                                                                                                                  Query Match

(I) are used for diagnosis, e.g. in vivo detection/localisation of cancer, blood clots etc., also in vitro when immobilised on solid supports or blosensors and therapeutically, modified VLD may have binding affinity for drugs, steroids, pesticides, antigens, growth factors, tumour markers, cell or viral proteins. Modification of VLD improves solubility and alters binding specificity. Since VLD are derived from human proteins, the need for a humanizing step (to avoid adverse immune responses) is avoided, and modification also improves expression in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, wall folded and highly expressed. The polypeptides which are functional, wall folded and highly expressed. The polypeptides obtained can be used in capresent clones selected after panning primary and somatic NNK libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone,

The specification describes a method for screening for functional CC polypeptides which bind a ligand. The method comprises contacting a CC repertoire of polypeptides with a generic ligand, and then screening CC selected functional polypeptides with a target ligand. The method CC permits the removal from a chosen repertoire of polypeptides, those CC which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target tand. The method also permits the enrichment of a chosen repertoire weppeptides for those polypeptides which are functional, well folded by expressed. The polypeptides obtained can be used in a grophylactic and therapeutic procedures. ANY02473-Y02525 and tigens (bovine ubiquitin, rat BIP, bovine histone,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides which are functional, well folded diagnostic, prophylactic and therapeutic procedures. AAY02473-Y02525 represent clones selected after panning primary and somatic NMK libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone, NIP-BSA and hen egg lysozyme).

                                                                                 ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well fold and highly expressed. The polypeptides obtained can be used in diagnostic, prophylactic and therapeutic procedures. AAY02473-Y02525 represent clones selected after panning primary and somatic NNK libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone,
                                                                                                                                                         The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target

                                                                                                                                                                                                                              The specification describes a method for screening for functional copypeptides which bind a ligand. The method comprises contacting a crepertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of trame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in capable tichnes selected after panning primary and somatic NNK libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone, NYC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-NOV-1997;

The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides which are functional, well folded diagnostic, prophylactic and therapeutic procedures. ANYO2473-Y02525 represent clones selected after panning primary and somatic NNK libraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone, where the polypeptides which are functional to the polypeptides with 5 antigens (bovine ubiquitin, rat BIP, bovine histone, where the polypeptides with 5 antigens (bovine ubiquitin, rat BIP, bovine histone).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                21-NOV-1997;

                                                                                                                                                                                                                           The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a crepertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression cmutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire cof polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in crepresent clones selected after panning primary and somatic NNK clibraries with 5 antigens (bovine ubiquitin, rat BIP, bovine histone, with 5 antigens (bovine ubiquitin, rat BIP, bovine histone,

                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                               Score

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
